Rainfall conditions and agricultural season evolution: With the exception of the heavy precipitations recorded in the first and last ten days of June, and in the first ten days of August, (rainfall volumes between 53 and 188 percent above the ten-day average) total cumulative precipitation from April to September was 50 percent below average. Short-term deficits were even larger, exceeding 50 percent during some 10-day tracking periods in May and August and reaching 40 percent during the last 20 days of September. The volatility of rainfall from June to September nevertheless favored the development of certain crops (e.g., pigeon peas, cassava, sugarcane, and bananas) and fodder, which are more drought-resistant and consume less water, but did not benefit other crops, such as beans and rice. This compounds the situation as previous harvests did not generate enough income to finance the summer and autumn campaigns.

Macroeconomic context: After several consecutive years of contraction, the Haitian economy continues to face multiple difficulties. The absence of political governance and the persistent security crisis, as well as climatic and health-related shocks, have had a significant impact on the country's economic activity. For example, the cyclical index of economic activity (ICAE), calculated by Haiti Institute of Statistics (IHSI), showed a contraction in economic activity of -2.1 percent during the second quarter of 2023, contributing to the decline in national output for the 2022-2023 fiscal year. Thus, the macro-economic framework in Haiti is marked by unemployment, inflation, exchange rate volatility, fiscal, and trade balance deficits, among others. This situation has further highlighted the major challenges facing the country.

Additionally, during the first half of 2023, a decline of around 9 percent in remittances or migrant transfers was recorded, an atypical trend in times of
