Climate Prediction Center's Central America Hazards Outlook
August 7 – August 13, 2014

- **Dryness worsens throughout many areas of Central America.**

1) Extended dry spells and below-average rains since March have led to substantial seasonal rainfall deficits and poor ground conditions in southeastern Honduras west-central Nicaragua, and parts of northern Costa Rica. Poorly distributed Primera rainfall and acute dryness during mid-June has also led to failed crops through eastern El Salvador, southern Honduras, and eastern Guatemala.

2) Since late June, suppressed and poorly distributed rains across central Guatemala, southern Honduras, El Salvador, and western Nicaragua is likely to negatively impact developing Primera Crops.
